

# SyAM Education Tool Tip:

## Simplified Enhanced Imaging System Client Version 4.34

### Imaging with v4.34:

When using SyAM System Client v4.34 and above, features have been added that will simplify the process of capturing and deploying Desktop images containing the configured System Client.

### 4 Simple Steps

1. Install the **System Client (v4.34 or above)** on the machine that is being configured for the master image.
2. Add the SyAM **System Client** to the **System Area Manager**, and program it with a default **Location** and **Function** that you wish for the imaged systems to use.
3. Configure the **Power Management** schedule and settings that you wish for the imaged systems to use.
4. Save your Master Image and start deploying to your target systems.

When the imaged systems start up they will now automatically correct their internal SyAM ID (referred to as the SyAM GUID). Within a few minutes the newly imaged systems will start reporting up to the System Area Manager. They will be in the default Location and Function groups that you defined, and will have their Power Settings already programmed. So aside for any modifications to their Location or Function, no further configuration will be required.

If the systems imaged had previously been managed by the System Area Manager they will now appear with their new Machine Name, replacing their old name in the Management tree. The System Area Manager will automatically identify them and update the SyAM Database with their new details, linking the history of the hardware to the new machine name and will not require any further licenses to manage them.
