

SyAM Software

Using Management Utilities to Install SMART Notebook 10

Management Utilities can be used to perform a silent installation of SMART Notebook 10.

Download SMART Install Manager software and SMART Notebook software. Run the SMART Install Manager executable to install the program, which will be used to create the .mst file that contains your product key and any other customizations you choose. Unzip the SMART Notebook software archive file.

Run SMART Install Manager. From the SMART Notebook software folder, drag and drop the file SMART Notebook.msi into SMART Install Manager. Enter your product key, and review any installation options you wish to customize. When finished, choose Publish from the File menu to create the .mst file.

Create a batch file to perform the installation using msiexec:

```
c:  
cd \  
msiexec /i "\\192.168.100.156\apps\SMART Notebook.msi" TRANSFORMS="smartnotebook.mst" /q  
exit
```

Modify the example batch file to specify the location of your default application directory and the name you gave the .mst file. Place the batch file, the .msi file, and the .mst file in the default application directory defined in the Administration Settings of Management Utility, where the file depsvc.exe is also present.

In the Management Utility, create a Third Party template to install SMART Notebook software. Enter a template name. Select the target platform and authentication template. Enter the path to the network share (this will be filled in already if the default path has been entered in Administration Settings) then click the Find Files button and choose the batch file (e.g. smartnotebook.bat) from the drop down menu.

Configure Template

Third Party Deployment Template

Template Name:

Third Party Executable Details

Target Platform

Windows

Linux

Mac OS X

Select the authentication template with credentials to browse the network share entered below

Windows ▾

Path to directory containing source executable file (depsvc.exe MUST be present in this directory):

Find Files... ▾

\\192.168.100.156\apps\smartnotebook.bat

Timeout (minutes)

Parameters

Do not check for process completion (for BIOS updates)

Add

Copy these files locally to each target machine before installing (required if the above is not a network share, cannot be used with local impersonation)

No files have been added yet.

Copy these files locally to each target machine before installing (required if the above is not a network share, cannot be used with local impersonation)

File Path	Parameters	Timeout	Ignore Process Completion	Platform
\\192.168.100.156\apps\smartnotebook.bat		10	No	Windows Edit Delete

Copy **Remove**

Click the Add button, save changes to the template, and click OK to confirm.

Deploy the application by choosing Create A New Job from the Functions menu. Choose Discovery as the first task to define the group of affected systems, then choose Deploy Third Party Software and select the newly created third party software template. Click the Run Job button, then click OK to confirm. Deployment can also be done by highlighting a system in Groups, then right-clicking and choosing Deploy Third Party Software. Select the third party software template, click Run Job, then click OK to confirm.
